

Alaska Blind Child Discovery

a cooperative, charitable research project to vision screen every preschool Alaskan

Mountain Project: Vision Screening

Reasons for Vision Screening

Good adult vision must be learned during the first ten years of childhood. Amblyopia is a potentially curable disease of disrupted vision learning due to blocked images (cataracts or corneal scars), poor or unequal focus (myopia, hyperopia, astigmatism, or anisometropia) or misalignment (strabismus –cross eye, wall eye). Amblyopia treatment is most successful if started in pre-verbal children. Prior to photoscreening, this blinding condition has been difficult to detect.

Your child has been screened by a binocular, infrared autorefractometer called PlusOptiX SO4 that gives an estimate of your child's refractive error. Please Note: This reading **SHOULD NOT** be used as a prescription for glasses.
